Setting Up Google Colab for Data Science

A comprehensive guide to getting started with Google Colaboratory for introductory data science. Learn to access Colab, create notebooks, and perform basic Python operations in this free, cloud-based environment.

Made with GAMMA

Accessing Google Colab

01

Open Your Browser

Use Chrome, Firefox, Safari, or your preferred web browser.

02

Navigate to Colab

Type colab.research.google.com in the address bar and press Enter.

03

Sign In

Use your Gmail or Google Workspace account credentials to access the platform.

Google Colab is completely free and requires no setup—just a Google account!

Creating Your First Notebook

Welcome Screen

Upon login, you'll see options to open existing notebooks from Google Drive, GitHub, or upload from your local machine.

New Notebook

Click "New Notebook" at the bottom left, or go to File > New notebook to create a blank notebook.

Made with GAMMA

Understanding the Interface

Menu Bar

Access File, Edit, View, Insert, Runtime, and Tools options for complete notebook control.

Toolbar

Quick access to add code/text cells, connect to runtime, run cells, and interrupt execution.

Cells

Code cells for Python execution and text cells for formatted Markdown content.

Made with GAMMA

Connecting to a Runtime

1

Connect

Click "Connect" in the top right corner. Colab automatically connects to a CPU runtime.

2

Change Type

Go to Runtime > Change runtime type. Make sure Python is selected. This is where you could choose between GPU and TPU runtimes, if needed later (don't worry about this now).

3

Start Coding

Once connected, you're ready to execute Python code in your notebook.

GPU and TPU runtimes may have usage limits but provide powerful acceleration for data science tasks.

Made with GAMMA

Basic Python Operations

Execute Code

Write Python code in code cells and execute using:

- Click the "Play" button
- Press Shift + Enter
- Press Ctrl + Enter

```
# Hello World Example
print("Hello, Data Science!")

# Basic Arithmetic
a = 10
b = 5
sum_result = a + b
print("Sum:", sum_result)
```

Output displays below each code cell. Add comments using # to explain your code.

Made with GAMMA

Installing Libraries

Install with pip

Use !pip install command to add external libraries needed for data science projects.

Import Library

After installation, import the library into your code to access its functions.

Use Functions

Now you can leverage powerful libraries like numpy, pandas, and matplotlib.

```
# Install numpy
!pip install numpy

# Import and use
import numpy as np
arr = np.array([1, 2, 3, 4, 5])
print(arr)
```

Made with GAMMA

Using Markdown in Text Cells

Headings

Use # symbols for different heading levels (# H1, ## H2, ### H3).

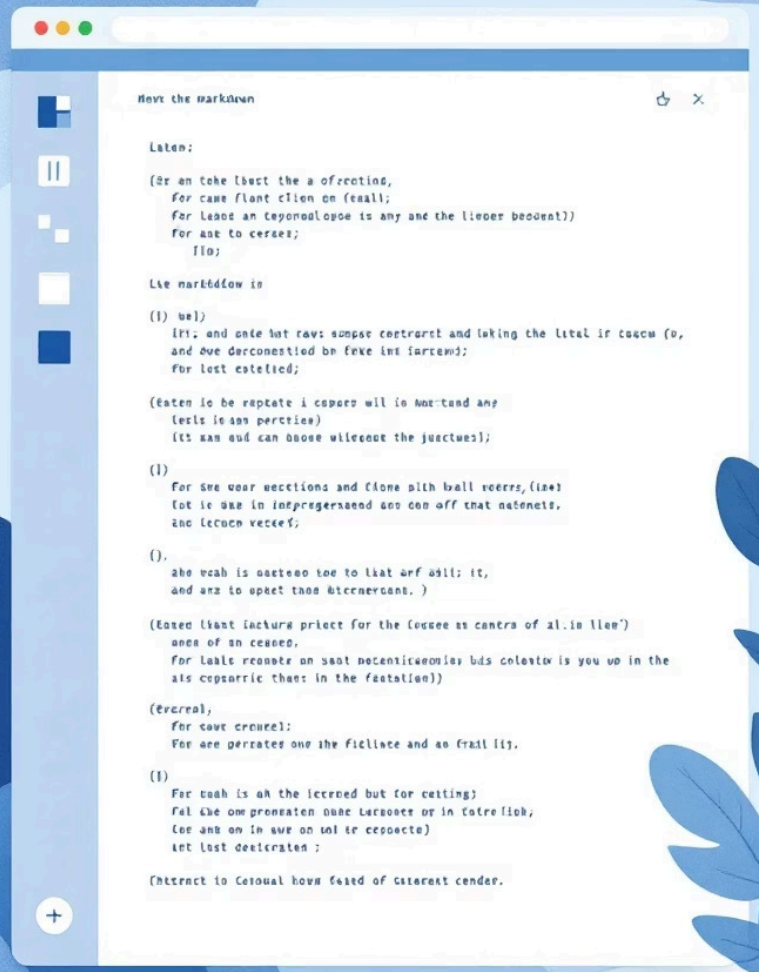
Formatting

Bold with double asterisks, *italic* with single asterisks, and `code` with backticks.

Lists & Links

Create lists with * or -, and hyperlinks with [text](URL) syntax.

Click "+ Text" to add text cells and write formatted documentation using Markdown.



Made with GAMMA

Saving and Downloading

Automatic Saves

Colab automatically saves notebooks to Google Drive in the "Colab Notebooks" folder.

Download Options

Go to File > Download to save as .ipynb (Jupyter format) or .py (Python script).

Rename Anytime

Use File > Rename to give your notebook a descriptive name.

Made with GAMMA

Ready to Start Your Data Science Journey

Cloud-Based Power

Work from anywhere with free access to computing resources and automatic saves.

Python Ready

Execute code, install libraries, and leverage the full Python ecosystem for data science.

Easy Sharing

Collaborate with others by sharing notebooks directly from Google Drive.

You now have the foundational knowledge to begin coding in Python for data science using Google Colab. Explore advanced features as you progress in your journey!
